QUALITY STANDARDS AND CERTIFICATION

Technically superior products at fair prices have made us a well-established player in the measuring instrument market. For more than 35 years we have been constantly moving upward. The utilization of state-of-the-art machinery and equipment, and efficient, high-performance production processes, ensure high product quality "Made in Germany" at competitive prices.

We produce and develop exclusively in Germany – this is the only way to guarantee the high-quality standard of our products. Our quality management is certified according to ISO 9001:2015 and for Ex products additionally according to DIN EN ISO/IEC 80079-34:2020-06.

Since July 1st, 2003, conformity to directive 94/9/EC ("ATEX directive") has been mandatory for Ex products in the member states of the EC. Our development, production and sales have been certified according to RL 94/9/EG since May 1st, 2003. Several products have already been tested and approved according to this standard.

Measurement data, at hand.

The focus on compact designs takes up a lot of attention at Greisinger. After all, the specialist for portable instruments condenses innovative technology and metrological precision into products that have format.

As a strategic business area for temperature sensors and portable instruments, Greisinger concentrates the long-standing know-how of experienced specialists under one roof at its Regenstauf site. Here, current market trends are monitored and taken into account in the development of new technologies.

In doing so, our tradition-rich company is built on many years of experience spanning more than 35 years. Even our first products – then the first temperature sensors for monitoring hay stacks – met exactly the market requirements and laid the basis for our further success. Meanwhile, our product portfolio has expanded significantly: In addition to numerous transmitters and displays and the associated sensor technology, we primarily develop and produce high-quality portable instruments.

Originally developed for the toughest and harshest conditions of our industrial customers, end-users can also purchase our equipment through retail channels. Over 100,000 instruments sold

and tens of thousands of satisfied customers every year are our motivation to build better and better measuring devices.

We constantly keep all machines and equipment in our production and quality control at the latest state of the art. As part of the GHM GROUP, we participate in ongoing improvement initiatives to further optimize our processes and procedures. This will enable us to continue to offer outstanding product quality "Made in Germany" at competitive prices.

DAKKS CALIBRATION CERTIFICATE

DAKKS calibration certificates are used for very high-quality calibrations and calibrate reference instruments or standards and regulations requiring those certificates. DAKKS-DKD calibration certificates are issued using reference instruments for which traceability is ensured through a link to the laboratory of the Physikalische Bundesanstalt. DAKKS-DKD calibration certificates can only be issued by calibration laboratories accredited according to the DIN EN ISO 17025 standard.

Periodic external assessment and reaccreditation ensure that calibration is of a consistently high quality. These costs- and personnel-intensive measures result in a higher price, but, in return, provide the necessary reliability in the measurement results. Successful DAKKS assessment of the Greisinger site for the measured variable temperature. The calibration laboratory has been working in accordance with DIN EN ISO / IEC 17025 since 2018.

At our Delta Ohm site in Padua/Italy, calibration certificates can be issued for measurands, for which only a limited number of recognized laboratories exist in Europe. The calibration laboratory is equipped with the latest measurement technology, is also accredited according to the DIN EN 17025 standard and is regularly assessed by ACCREDIA. Due to the worldwide recognition of calibration services by the umbrella organization ILAC *, the validity of the calibration certificates in Germany and Europe and around 100 other countries is guaranteed by the ILAC. The calibration certificate will be issued in German. We offer the listed ACCREDIA calibration certificates for portable instruments marked with the symbol

*ILAC (International Laboratory Accreditation Cooperation) has been in existence for over 40 years with a sole focus on laboratory accreditation, with members representing over 70 countries and regional organizations. The ILAC MRA recognition agreement obliges all members to mutually recognize calibration results that have been created by nationally accredited laboratories (e.g. DAKKS or ACCREDIA).

ISO CALIBRATION CERTIFICATES

GHM-Greisinger creates ISO calibration certificates (factory calibration certificates) according to the same standards as DAkkS calibration certificates. Still, since there is no need for an external assessment, these certificates can be issued at a lower cost. In addition, there are measurands for which no accreditation can be performed in the DAkkS-DKD. In these cases, ISO calibration is a valuable alternative. ISO calibration certificates are created with standards subject to regular test equipment monitoring; this ensures the traceability of the standards used. The calibration may include an adjustment of the measuring instrument (only for Greisinger devices).

For portable instruments marked with the symbol  we offer the listed ISO calibration certificates. ISO calibration certificates can also be issued for transmitters or the combined display device and transmitter / sensor. Calibration certificates are not included in the scope of delivery of measuring instruments.

INFORMATION

SOME BACKGROUND INFORMATION ON TEMPERATURE MEASUREMENT

Resistive: Pt100, Pt1000

The sensor element changes its ohmic resistance via the temperature. This is evaluated by the display device and converted into a temperature.

With Pt100 in particular, a distinction is made between 2-, 3- and 4-wire connection. With 3- and 4-wire connections, the serial cable resistance can be automatically compensated as a source of measurement error.

Features:

- o Highest precisions attainable
- o High replacement accuracy of the sensors especially for Pt100 and Pt1000
- o Standard measurement method for reference measurements

CONCLUSION:

Slightly sluggish as a thermocouple probe, but highly precise. With our particularly optimized designs, response within seconds is nevertheless possible – see our 1.5 mm needle probes.

Thermocouple: Type K, Type N, Type S...

When two different metal compositions (e.g. NiCr and NiAl) come in contact, a voltage is generated between the connection point (probe) and the display unit, nearly proportionally to the temperature difference. This "thermal voltage" is evaluated by the display unit and converted into a temperature.

Features:

- o Very small sensors can be implemented; thus, a very short response time possible – best suited for surface measurements
- o Temperatures up to 1750 °C can be measured (depending on the design of the sensor and the thermocouple used)

CONCLUSION:

very fast, very flexible and large measuring range

CALIBRATED MEASURING SYSTEMS PT 100

GENERAL:

The total measurement errors result, among other things, from the sum of the measurement errors of the device and the probe. In order to keep this as low as possible, we offer you the following calibrated and optimized measuring systems. Due to their excellent system accuracy, these are excellently suited for quality assurance within the scope of ISO9000ff, as reference devices in production, service, and maintenance, etc. The system is optimized by creating a characteristic curve that is determined separately for each temperature sensor and stored in the device (GMH 3750) or by sensor calibration with the aid of zero point and slope (GMH 3710). Due to the low measuring current, there is no self-heating of the sensor; furthermore, the measurement is thermo-voltage compensated.

GENERAL:

In the development of the new G 1200 series, the focus was intentionally on the essential functions of the measurement technology – the sophisticated thermocouple reference point is the center of attention – for the best final accuracy – here, despite the favorable overall price in a peer class comparison, no savings were made! Precision, speed, and reliability, all packaged in a compact and waterproof housing (exception: probe connection), makes the device a reliable partner for professional users and demanding hobbyists, Made in Germany.

Thanks to the first-class thermocouple compensation ("virtual ice point") with high-quality reference temperature measurement and a sophisticated design, they achieve unrivaled measuring reliability in this class.

APPLICATIONS:

For quick measurements in the kitchen, laboratory, industry, trade, research and teaching and many more. Fast and precise: with our wide range of interchangeable probes, they can be adapted to any application. Our high-quality thermocouple probes all correspond to the best thermocouple class 1. For the highest precision requirements: please note sister device family G 17xx Pt1000 thermometer.

HD 2178.2

Item No. 474932

Thermometer with two inputs (1 x Pt100, 1x thermocouple) and logger

GENERAL:

The HD2178.2 can be used with both Pt100 sensors and thermocouples. Pt100 sensors with SICRAM connectors are connected to connection B (8-pole DIN 45326 connector). The SICRAM connector already carries all sensor data such as serial number and calibration data. A thermocouple of the type K, J, T, N, E with a miniature flat plug can be connected to connection A. The data logger can save up to 80,000 measured values, conveniently transferred via USB cable and the supplied software if required. Battery operation, a large display, and robustness make the HD2178.2 a perfect all-rounder. Naturally, the HD2178.2 also offers MAX, MIN, AVG, REL, and HOLD functions.

APPLICATIONS:

The wide variety of sensors offered (as contact, immersion, insertion sensors, or for air temperature) opens up a multitude of applications in a wide variety of industries.

GENERAL:

With the GFTB 200, measurements of air pressure, humidity, and temperature are possible within a matter of seconds. Thanks to the use of high-precision sensors, the device achieves significantly better accuracies than comparable devices.

The dew point temperature monitoring with the GFTB 200 also provides effective protection against possible moisture damages caused by condensation in buildings and thus also against mold infestation. The integrated alarm function also reminds the user acoustically of sensible ventilation, which enables optimal and efficient use of the heating energy. With the additional measured variables such as wet bulb temperature, absolute humidity of the air, the air condition can be represented precisely and clearly.

MATERIAL MOISTURE DETERMINATION WITH PORTABLE INSTRUMENTS

METHOD

- **Resistance measurement method**
(GMR 110, GMH 3810, GMH 3831, GMH 3851)
The electrical resistance of the material is in many cases a measure of the material moisture. The devices measure the (sometimes extremely high) resistance values and convert them into humidity values with the help of integrated characteristic curves. The temperature has to be compensated especially when measuring wood – all GREISINGER devices have an integrated temperature compensation. For connection, nails are usually used, which are hammered into the material to be measured.
- **Capacitive measuring method**
(GMK 210, GMK 100, GMI 15)
The dielectric properties of a measuring object can often be used as a measure of the material moisture. Water has a dielectric constant that is many times higher than that of dry wood or building materials. This makes it possible to make quick and easy statements about the humidity content of the measured material on the basis of the total dielectric constant of the measured object. The measurement is taken by placing the measuring instrument on top. Prerequisite for this: flat surfaces, no metallic components.
- **Relative humidity**
(eg with GMH 3331 + TFS 0100 E)
In addition, the material moisture can be measured indirectly via the relative humidity: In a closed room within a material, a moisture is established that is dependent on the material moisture. With a so-called sorption isotherm or a corresponding table, the material moisture can be calculated from the air humidity.
- **Darr test**
The Darr test is the material moisture reference measurement with the highest accuracy. Here, moisture material is weighed, then dried at elevated temperature until no more weight loss can be determined. The material moisture is then determined from the wet and dry weight.

UNITS

- **Material moisture u (also "atro"):**
Based on the dry mass of material humidity u [%] = (mass wet – mass dry) / mass dry * 100 Is mainly used by joiners, carpenters and the like.
- **Water content w:**
Material humidity related to total wet mass Water content w [%] = (mass wet – mass dry) / mass wet * 100 Is mainly used for the evaluation of gasolines.
- **"Digit" (GMI 15)**
The display value is relative, ie without a physical unit. This allows good comparative statements to be made regarding the humidity content of the same materials. Smaller values mean lower and higher values mean greater humidity.

For further information on this subject, please refer to the operating instructions or at our homepage www.greisinger.de.

GMI 15

Item No. 600059

Wood and building moisture indicator

GENERAL:

Device for the quick determination of moisture in buildings, on construction sites, etc. With the help of the GMI 15, the moisture of wood can be detected up to a depth of approx. 3 cm or of concrete or screed up to a depth of approx. 4 cm. It even detects moisture behind ceramic tiles or various wall and floor coverings. The measurement is carried out simply by placing the device on the surface to be measured – no need to pierce the object to be measured! The display is via "Digit" and is relative, i.e. the values can be compared well with known moistures.

APPLICATIONS:

Moisture evaluation for, e.g., real estate agents, property managers, homeowners, architects, surveyors, contractors, etc.

Note:

The GMI 15 is an indicator for a quick overview – however, it does not replace a measuring instrument such as the GMH 3810, GMH 3831, GMH 3851 or GMK 100

Salinity determination

Salinity is the sum of the concentration of all dissolved salts in sea water. The information is given in g/kg (corresponds to PSU = Practical Salinity Unit).

TDS determination (total dissolved solids)

The total dissolved solids describes the mass concentration of the dissolved substances in a liquid. The information is given in mg/l.

Calibration interval (not GMH 3511):

after a selectable period (1 .. 365 days or inactive) a recalibration is requested.

GMH 3551: additional calibration history

Redox measurement (ORP): 2 options are available:

"mV": Standard redox or mV measurement
"mV_H": Starting from the standard redox electrode used (eg GE 105 with the Ag / AgCl system and 3 mol KCl), a temperature-compensated conversion to the hydrogen system is carried out in accordance with DIN38404 Part 6, Table 1.

rH measurement (not GMH 3511): The rH value is calculated using a redox measurement and manual entry of the pH value. The pH value can also be taken from a previous pH measurement.

Analog output: 0..1 V, permanently set 0.1 V ± 0.14 pH or -2000 .. + 2000 mV, connection via 3-pole jack socket Ø 3.5 mm, resolution 13 bit,

G 1501-G125

Item No: 414689

Waterproof pH/redox meter with Pt1000 input and alarm, device complete with pH electrode GE 125 (PT1000)

GENERAL:

When developing the new G 1000 series, the focus was consciously on the essential functions of the measurement technology. Measurement with a focus on precision, speed, and reliability, packed into a compact housing, delivers an outstanding price/performance ratio. Made in Germany. The new portable instruments also have an impressive ergonomic design, are dust- and water-proof to IP 65/67, and feature a backlit display. The compact pH-Meter is the alternative to pH sticks on the one hand and to complex mid-range devices on the other. The G 1501 enables redox (ORP) measurement (with temperature-compensated conversion from the Ag/AgCl reference system to the hydrogen system in accordance with DIN 38404 Part 6, Table 1) and automatic temperature compensation when a Pt 1000 temperature sensor is connected for the measured variables pH and mV_H. An optical and visual alarm signal (min/ max) is also included.

Aquarium and aquaculture, plant farming and agriculture, laboratories, quality assurance, service, food, ...

Item No. 606158
Extension cable for electrodes with BNC connection, cable length: 3 m

BNC connector

S7 connection on the electrode shaft

DIAPHRAGM:

The membrane establishes the electrical connection between the reference system and the sample. At the same time, it should prevent the medium to be measured from contaminating the reference electrolyte.

Ceramic membrane

Porous ceramic rods are inserted to allow low outflow rates.
Application: general applications in clean to slightly dirty media

Joint / movable cut

The roughened surface between the cut glass of the electrode and the glass sleeve enables an electrolyte flow of several ml/h.
Application: low-ion and heavily soiled samples

Pellon membrane

A Pellon tissue is inserted. The permeable membrane enables fast response times and stable measured values.
Application: in clean to slightly soiled media

Ceramic rod

Glass sleeve

REFERENCE ELECTROLYTE:

The reference electrolyte enables a constant voltage in the reference system and establishes the electrical connection between the membrane and the reference electrode.

Liquid electrolyte

3 mol/l KCl is mainly used here. Liquid electrolytes usually enable a faster response time and can be replaced if they are dirty.

Gel electrolyte

This is where the electrolyte is solidified in order to reach low-maintenance electrodes that allow a short-term measurement regardless of the position. No noticeable leakage of electrolyte can be observed under normal measuring conditions.

ELECTRODES WITH S7 CONNECTION:

The electrodes offered are equipped with an S7 industrial screw plug head, which is also known as the S8 industrial screw plug head. In contrast to the S7 laboratory plug head, this is suitable for direct installation in fittings with PG 13.5 thread.

GENERAL:

When developing the new G 1000 series, the focus was consciously on the essential functions of the measurement technology. Pure measurement with a focus on precision, speed and reliability, packaged in a compact housing, enables the outstanding price/performance ratio, Made in Germany.

The new portable instruments also have an impressive ergonomic design, are dust- and water-proof to IP 65/67, and feature a backlit display.

The oximeter with the maintenance-friendly galvanic sensor is an entry-level device suitable for everyday use, both concentration in mg/l (ppm) and saturation in percent can be read off directly without using tables.

The adjustment takes place at the push of a button in ambient air. For field use in bodies of water, the use of a GSKA protective cap is recommended to protect the membrane.

GENERAL:

The G 7500 is a convenient multi-channel water analyzer for the simultaneous measurement of two measured variables and the associated one temperature.

All the essentials can be combined electrochemical measurements:

- pH/ORP + conductivity/salinity
- pH/Redox + dissolved Oxygen

The illuminated graphic display shows all parameters in plain text German or English, other languages can be integrated (Charges on request). Large display or measured value diagrams can also be displayed. The use of our proven standard connectors ensures that you can use our standard sensors – consciously without surcharge through complex technology in the sensors. Thus, the device is impressive due to the performance and the affordable system price (see also our sets). The modern device platform uses the usual USB cable for charging the internal batteries (interchangeable) and to access the data logger without any additional software or adapters are necessary. The logger is comfortably accessed like a USB 2.0 data stick.

APPLICATIONS:

You have applications such as water monitoring, neutralization processes or agricultural surveys neatly under control.

- Water monitoring
- Fresh water treatment
- Sewage treatment plants
- Fish farming and aquaculture
- Vertical/urban farming
- Conventional agriculture

MULTISENSOR WATER ANALYSIS PORTABLE INSTRUMENT

Based on our proven single parameter instruments G 1000/GMH 3000/GMH 5000 a multi-channel measuring instrument has been developed. This combines the multi-channel measurement in the proven housing of the GMH 5000 series.

Numerous applications require the simultaneous measurement of several measurands. For example, the simultaneous measurement of pH and oxygen is desired in water monitoring – the G 7500 determines both measured values in one device.

One of the very interesting areas of application, the combination of pH and conductivity, are the current trend markets of vertical farming / Urban farming.

A backlit graphic display suitable for daylight is used for optimal visualization. At the same time, simple measurement and comparison are guaranteed thanks to the plain text display that can be converted into different languages. There are no longer any limitations in the recording of measured values, as the memory size of the data logger is very large.

Our proven sensor connections are consciously built into the devices. This keeps the system costs manageable and ensures the flexibility of free sensor selection to match your focus.

Atmospheric oxygen sensor, open version, incl. GOEL 370, for protective gases with high CO_2 concentration and $O_2 < 35 \text{ vol. } \% O_2$, long life, suitable for GMH 369x

GENERAL:

- Suitable for air or gas flow
- Fast temperature compensation

APPLICATION:

Due to the special sensor construction, the sample gas "flows around" the sensor and can escape into the open through the holes in the housing. If there is a slight flow onto the sensor, no pressure can build up that would falsify the measurement result. Particularly suitable for measuring gases from pressurized cylinders, etc. and can also be used for room gas measurements without further ado.

GENERAL:

This housing is ideal for devices with an external pressure connection (GMH 569x/369x). Especially in systems with overpressure or underpressure or with existing back pressure due to flow.

APPLICATION:

It can be mounted airtight (attention: observe the permissible operating pressure!). The device pressure connection is connected to the sensor pressure connection. The device measures and compensates for the actual pressure at the sensor.

Art. No. 482448

O₂ analyzer, MOD function, 0..100 %, case GKK 252, diving tank adapter GZ 5826, sensor in box

GENERAL:

The G 1690 intentionally focuses on the essential functions of measurement technology for the reliable measurement of oxygen concentration in gases. The sensors used, GOEL 370 and GOEL 381, are essential for reliability and longevity, and are especially suitable for wet environments. The devices also impress with their ergonomics, water protection and display lighting.

APPLICATION:

Thus, the G 1690 is an economical and precise submersible instrument, but at the same time a high-quality entry device for many other oxygen measurements – for example, inert gas measurements.

Note: the device is used for additional checking. It does not replace an approved measuring instrument or safe methods of creating gas mixtures

GCO 100

Item No. 600062
Compact portable CO instrument with alarm

GENERAL:

Carbon monoxide (CO) is produced when carbon is burned. Depending on the effectiveness of the combustion (oxygen supply) and the combustion temperature, more or less CO gas is produced. The gas is flammable and highly toxic. It is invisible, tasteless and odorless.
Even the smallest concentrations are dangerous for humans!
Therefore, there are guidelines in Germany about the maximum workplace concentration (MAK/AGW) of CO gas: 30 ppm

APPLICATION:

- Monitoring of air quality (e.g. in the workplace)
- Control of heating systems, gas boilers, fireplaces
- Air monitoring during maintenance work (tunnels, exhaust gas routes, ...)
- Detection of CO in the breath of smokers (% CO Hb)
- Detection of CO poisoning, e.g. in the case of fire victims (fire departments, etc.)

INDOOR AIR QUALITY MONITOR

HIGHLIGHTS:

- The measurement of the air conditioning parameters enables a meaningful assessment of the air quality and ventilation efficiency.

HD21-ABE-17

Item No. 409559

Indoor air quality monitoring device (IAQ)

GENERAL:

The HD21-ABE-17 IAQ monitor is a laboratory device / portable device for analyzing indoor air quality (IAQ), Indoor Air Quality.

The device simultaneously measures the following values:

- Carbon dioxide (CO₂)
- Carbon monoxide (CO)
- Atmospheric pressure
- Temperature
- Relative humidity

and calculates:

- Dew point
- Wet temperature
- Absolute humidity
- Mixing ratio
- Enthalpy

For closed rooms in which people are staying, kitchens, bathrooms, changing rooms and swimming pools are also included due to their high humidity. The measurement of the CO₂ concentration also allows conclusions to be drawn about chemical, physical and biological pollutants. UNIVERSAL PRESSURE MEASUREMENT SYSTEM

1000 LIVE MEASUREMENTS PER SECOND

SAME SENSORS AS FOR HANDHELD GMH 3151 CAN BE USED

HIGHLIGHTS:

- Complete package including software for current MS-Windows Version
- Live display and live curve display

GDUSB 1000

Item No. 600271

Complete package for high-speed live measurement data acquisition for MSD/GMSD sensors including high-speed live measurement data acquisition software GDUSB FastView

GENERAL:

The GDUSB 1000 adapter enables a standard pressure sensor of the type GMSD/MSD to be connected directly to the USB interface of a PC. The adapter provides 4 channels, i.e. current measured value, mean value, maximum and minimum value. In addition, the device has two operating modes:

Fast mode:

Up to 1000 readings per second. The supplied software displays the data and saves it for further processing at a later date. The software can start and stop the recording under various adjustable trigger conditions.

Standard mode:

Up to 32 readings per second. Similar to a GMH portable instrument or EASYBus device, using the EBS 20M/EBS 60M software then offers the option of long-term recording (2 measured values per second).

APPLICATIONS:

- Test rigs and laboratory experiments
- Detection of pressure peaks
- Checking of operating pressure curves, for example in process technology, in machine and plant construction
- Live display of the measured values of several GDUSB 1000
- Data evaluation and logging for process optimization or for statistics
- Multi-channel measurements with a high recording rate
- Measurement setups or on-site recording with GDUSB 1000

ADDITIONAL FUNCTIONS:

Serial interface: Can be connected directly to the RS232 or USB interface of a PC via galvanically isolated interface converter GRS 3100 or GRS 3105 or USB 3100 N (accessory).

for GMH 3181:

Low power logger mode: (only in the "slow" measuring cycle) A measurement is only carried out at the end of the set logger cycle time. This significantly extends the battery life. For long-term recordings (e.g. leak test).

Averaging: The measured values are integrated over an adjustable time and the averaged display value is output.

Control function: Using the GAM3000 switching module (optionally available), external devices can be controlled (switched on/off) or monitored for alarms (see accessories)

Logger functions:

- manual: 99 data records
- cyclical: 10000 data records (max. 64 recording series), adjustable cycle time: 1..3600 s

Note on the pressure unit setting (valid for all GMH 31xx):

The selection of different pressure units is only possible if the entire measuring range of this unit can also be shown on the display and the sensor also supports this resolution.

GENERAL:

The development of the new G 1111 was intentionally focused on the essential measurement technology functions – a high-quality sensor is the heart of the measuring instrument – and despite the low overall price, no savings were made! This ensures that measurements are accurate and reliable: the excellent zero point stability and simultaneous position independence are "best in class"

Precision, speed and reliability, packed in a compact and waterproof housing makes the device a reliable partner for the craftsmanship. Made in Germany.
G1100 Series – The reference class for your pocket!

HIGHLIGHTS:

- State-of-the-art and functional housing – in pocket format
- Excellent price-performance ratio
- 3-line illuminated display / overhead display at the push of a button
- Robust, long battery life
- Fast, accurate and high resolution
- Zero point stable and independent of position
- Calibratable / traceable
- Made in Germany

APPLICATION:

The measuring range up to 200 mbar / 20 kPa and the high resolution of up to 0.1 Pascal in optimized fine pressure mode covers the essential applications in the area of gas pressure (150 hPa) and burner settings in one device. The high accuracy simplifies u. a. the dynamic pressure setting and is also suitable for draft measurements. The measured value is independent of the position – not a matter of course in this area! Suitable for HVAC: gas and burner pressures (compression), chimney draft measurement, preparation of the 4 Pascal test, blower door, filter test (e.g. automotive DPf, gasoline cell filter), replacement for U-tube manometer ...

GENERAL:

The development of the new G 1100 series was intentionally focused on the essential measurement technology functions – a high-quality sensor is the heart of the measuring instrument – which despite the low overall price was not economized here! Precision, speed and reliability, packed in a compact and water-protected housing makes the device a reliable partner of the trade, made in Germany. G 1100 Series – the pocket-size benchmark class.

APPLICATION

For fast measurement in meteorology, aviation and motor sports, hiking, cycling and more. Fast, precise and high-resolution: resolution 0.1 hPa (mbar) and resolution of the pressure-derived altitude display 0.1 m! As a reference for countless devices with integrated barometer sensor. Barometer sensors are used in countless applications: for example, vehicles with combustion engines (air pressure as an important parameter for engine control), altimeters (calculation of altitude via barometric altitude formula), navigation systems, smartphones and, of course, in weather stations. But is the displayed absolute pressure correct? Due to the traceability of the devices via optional calibration certificates (ISO 17025, DAkkS), the barometer serves as a perfect reference device for checking the actual accuracy of corresponding devices.

HD-2010-UC-1

Item No. 700060

integrating sound level meter

GENERAL:

The HD-2010-UC-1 is a portable, integrating sound level meter for performing statistical analysis. During the development of the device, the focus was on combining the simplest possible operation with low costs. In addition, special care was taken to ensure that the device can be adjusted and set. The user can update the firmware directly using the noise studio program supplied with the device. The HD-2010-UC-1 has a graphic display with backlighting.

APPLICATIONS:

- Assessment of the ambient noise level
- Optional "extended measurement data logging"
- Optional recording and analysis of sound events
- Statistical analysis with calculation of 3 percentile levels and optional comprehensive statistical analysis
- Noise monitoring (option "Extended measurement data acquisition" required)
- Detection of impulsive noises
- Measurements at workplaces (analysis of noise and vibration exposure)
- Selection of personal protective equipment (hearing protection, SNR and HML method)
- Control of the production quality
- Measurement of machine noise, sound power measurements
- Noise emissions from vehicles

With the sound level meter HD-2010-UC-1, the sound pressure level can be measured by programming 3 parameters, whereby the frequency weighting and the time constants can be freely selected. The measured sound levels can be recorded in a large memory and transferred to a PC using the Noise Studio software package supplied.

The class 1 sound level meter HD-2010-UC-1 with the option "Extended measurement data acquisition" is suitable for noise monitoring and acoustic mapping as well as with the optional acquisition and analysis of sound events for the evaluation of the acoustic climate. IRRADIANCE IN THE SPECTRAL BAND OF BLUE LIGHT

LP 471-BLUE

Item No. 700070

Probe for photo- and radiometer HD2302, illuminance in the spectral band of blue light

GENERAL:

The radiometric probe LP471-BLUE measures the irradiance (W/m²) in the spectral band of blue light. The probe consists of a photodiode and a corresponding filter and is equipped with a diffuser for cosine correction.

APPLICATION:

The spectral sensitivity curve of the probe enables the measurement of the radiation that is the cause of damage due to blue light (curve B (λ) according to the ACGIH/IC-NIRP standards) in the spectral range of 380..550 nm. Radiation in this part of the spectrum can cause photochemical damage to the retina. Another area of application is the monitoring of the irradiance with blue light as it is used, for example, in the treatment of neonatal jaundice.

HIGHLIGHTS:

- Three independent sensor inputs with automatic probe recognition
- Graphic color display
- Data logger with SD card
- Automatic creation of PDF reports
- Mobility thanks to rechargeable batteries

HD 31

Item No. 482870

Universal 3-channel multifunctional data logger with graphic display

GENERAL:

The HD 31 is a universal data logger with the option of connecting up to 3 "SICRAM" probes. All relevant data (serial number, type, calibration data) are stored in the SICRAM connectors, so that the probes can be connected as required. The connected probe is automatically recognized by the HD 31. Further variables can be derived from the measured values. For example, the dew point temperature, wet bulb temperature, absolute humidity, etc. can be calculated from temperature and humidity. A total of 36 different measured variables are available.

Large color display to show three measured values in numerical form or a real-time graphic. The data is saved in CSV format on an SD card (storage capacity several months, even if several measured variables are logged every second). The HD 31 can be connected directly to a PC using the optional USB cable and is recognized as a mass storage device. In addition, the HD 31 automatically generates PDF logs, which are also stored on the SD card.

APPLICATIONS:

A large number of sensors and the measured variables derived from them provide a wide range of applications, for example in air conditioning and ventilation technology or in clean rooms. The following measured variables can be recorded:

- Temperature
- Relative humidity
- Pressure (absolute, gauge or differential pressure)
- Air speed
- Illuminance (lux)
- Irradiance (W/m^2)
- CO_2

Numerous derived variables can be calculated, displayed and saved from the above-mentioned measured values. For example, the absolute moisture in g/m^3 (from temperature and rel. humidity) or when measuring in ventilation ducts the volume flow (from the speed and dimensions of the ventilation duct), among other things more.

SICRAM modules are also available, via which external sensors with analog output signals can be connected:

VP 473:

SICRAM plug module for signal recording of external measuring transducers with voltage output, measuring range ± 20 VDC, input impedance 1 M Ω

IP 472:

SICRAM plug module for signal recording of external measuring transducers with current output, measuring range 0..24 mA, input impedance 25 Ω

VP 472:

SICRAM plug module for connecting pyranometers and albedometers with non-amplified signal output (adjustable sensitivity of 5..30 μV per W/m^2)

Electrode control device / level regulator in field housing for wall mounting – device without sensor

ALSCHU 300 SP

Item No. 600479

Electrode control device / level regulator in snap-on housing for top-hat rail mounting – device without sensor

APPLICATION:

Automatic control of drainage pumps and sewage lifting systems, overflow and boil-dry protection, automatic filling and emptying of containers, basins, tanks, control of the liquid level in storage containers, aquariums, holding basins etc. The ALSCHU 300 ... is suitable for the detection of conductive media (water, etc.). Less suitable are weak or non-conductive media (oils or greasy liquids) which form conductive foam or which build up an electrically insulating deposit on the electrodes.

MEASUREMENT METHOD:

The measuring method for level detection is based on the conductive principle, i.e. the electrical conductivity of the medium is monitored. If the switching amplifier detects a value lower than the preset conductivity, the status "medium recognized" is output, otherwise "no medium". Depending on the number and design of the connected level sensors, the device can be used for limit level detection (min / max detection) or as a 2-point controller.

GENERAL:

The measuring method for level detection is based on the conductive principle, i.e., the electrical conductivity of the medium is monitored. If the switching amplifier detects a value lower than the preset conductivity, the status "medium recognized" is output, otherwise "no medium".

APPLICATION:

Versatile alarm and protection device for DIN rail or wall mounting with universal input (screw terminal) for a large number of external sensors. All sensors with a switching threshold of <100 kΩ can be connected, such as water sensors, float switches, level switches, magnetic contacts, etc. In the event of an alarm, a connected device (e.g. pump, machine) can be switched on or off using a potential-free changeover contact, and an additional sound is emitted an acoustic alarm on the GEWAS 300 FG. To delete the alarm, the internal / external reset button must be pressed. The GEWAS 300 .. is suitable for the detection of conductive media (water, etc.). Less suitable are weak or non-conductive media (oils or greasy liquids) which form conductive foam or which build up an electrically insulating deposit on the electrodes.

GENERAL:

The compact water sensor lies flat on the floor (can be floor-mounted) and detects the finest water films – the device gives a loud alarm! Depending on the model, a solenoid valve is also switched off to stop the water from escaping and the machine is switched off to prevent sensitive pumps from running dry, for example. This combination of features surpasses the safety of simple aquastop systems or even that of many battery-powered control devices.

APPLICATION:

- Increased protection of washing machines and dishwashers and other catering equipment with a water connection
 - For water filters such as reverse osmosis systems, where simple tubing and connection systems can tend to leak.
 - For water treatment systems and pumps in hospitals, industrial systems, heating systems and much more besides!
- GEWAS 191 – the best possible security against water damage.
